

Satsafeti Intelligent Conveyor Solution

Enhancing Worker
Safety and Improving
Productivity with AI-
Based Video Analytics

Manufacturers are searching for solutions that can increase worker safety while improving productivity and reducing down time. That's why Satsafeti developed their Intelligent Conveyor Solution to help customers convert their existing conveyors into intelligent, self-acting machines. Built to integrate with DCS and PLC Systems, Satsafeti uses video analysis to predict, detect, and prevent both safety risks to floor operators and conveyor belt failure. Upon detection of danger to an operator, Satsafeti's system flags the instance, sends real-time alerts, and can also automatically stop the belt in two seconds or less to prevent worker injury. The Satsafeti system also provides equipment managers with predictive analytics for conveyor belt operations and integrity to proactively correct issues in operations and minimize production halt times. Lastly, Satsafeti offers customized maintenance robots to reduce human presence on the conveyor belt, creating safer working conditions and delivering maximum value in every working hour.
